

neatComponents removes the barriers keeping your new web presence from becoming a reality - by removing costly and time consuming programming.

Go straight from concept to completion. Cut site creation time and costs by 90%

neatComponents changes everything: broad scope with deep integration

- Easy large-scale web development.
- Fast small scale web development.
- Integrated email and Tweeting.
- Easily manage data structures.
- Self managing navigation.
- Content & Publication Management.
- Comprehensive User Management.
- Full E-commerce engine.

### What is neatComponents?

neatComponents is a Windows software Platform for website developers. It is a complete toolbox of encapsulated components for creating and managing all sorts of websites from a simple single-pager to the most sophisticated e-commerce or data-management website. It is fully integrated and installs from a single download. neatComponents has been designed to bring your projects to completion in days, not months. There is no coding, no programming and it is still fully flexible - without requiring creative compromises. It is not a mash-up of Open Source coding - so there are no licensing worries. It has been made from the ground-up so that components always work - there is no debugging thousands of lines of code and you never have to worry about interpreting code when staff turnover.

### Website designers

neatComponents provides powerful data handling tools, based on a relational database model. There is no limit to the quantity or complexity of the data structures. All components are configured from control panels - there is no code debugging to do. Advanced features allow for the efficient presentation of vast amounts of information, and tools provide elegant handling of hierarchical data structures. Navigation, CSS and full CMS plus many other functions are automatic.

### Business users

neatComponents doesn't need skilled programmers that are hard to find and are a hassle to manage. Outsourcing to contract workers or overseas can consume more management time that you have available. neatComponents means you don't need the expensive staff you thought you did. There are flexible licensing options, including pay-as-you-go.

### Cut site creation time & costs by 90%

It is not that neatComponents enables you to do something which is otherwise impossible, it is that it makes it fast and profitable ... and that's the difference between making websites as a hobby and as a business.

### Without compromising

All without compromising on the visuals or esthetics of the website. neatComponents naturally separates data handling from the visual appearance of the site. So sites can be redesigned without reworking the data-management ... and sites can be easily cloned for highly profitable site replication.

neatComponents is a fully formed, comprehensive web development system that will transform the way your organization works. Visit the website today to discover more about how **neatComponents changes everything**.

# neatComponents - website development and management system

neatComponents has been designed from the top down to make the creation of websites, Intranets and Extranets quick to build and easy to manage all without being a major drain on staffing or financial resources. It enables you to 'de-skill' website production and maintenance, so that you can redeploy internal staff and be more competitive in your marketplace.

## Minimize Staffing Costs

By allowing tight control but with easy access, neatComponents makes it possible to leverage the skills of your existing technologists. Unlike ordinary Internet development tools and simplistic Content Management Systems, the nC system does not require any programming at all. You are protected from complexity: the nC system cannot be broken. All functions are managed using straightforward dialog boxes. neatComponents makes it easy for website designers to create sites with what are otherwise difficult features. It takes care of all the fiddly technical administration which you'd normally need a programmer or a hosting tech to handle.

### Develop sites

Create websites quickly - simple drag & drop.

Content management: easy to use Direct entry for simple sites.

Navigation - Automatic, self-managing. Permission aware.

... with no specialist skills or technical knowledge.

### Manage users

Manage Users - allow editing and still keep control.

Unlimited Users & User Groups control page and site access.

Approval controls & workflow locking govern user access.

... fine-grain User permissions: page-by-page; item-by-item.

### Manage content

Control website appearance & make your own templates.

Content management: data-entry forms structure complex sites.

Email integration: 'on event', submission forms & responses.

... highly scalable - no client licences. Low training costs.

### Manage data

Input Forms give fast data integration & no code-writing.

Data Queries - advanced display using just basic database skills.

Full E-commerce - stock control, shipping, tax and payment.

... all without outsourcing or increasing your labor costs.

Website Development - without any programming to do. The system is component based, with each component configured from control panels. Each website has its own Layout Manager, and its own access permissions. Website building is a simple drag-and-drop from the 'store' of components into position on the site tree. Workflow-locking and Approval Controls keep you in control. Flexible licensing including pay-as-you-go. You will not need to employ additional staff for 'back-office' database support.

neatComponents provides powerful data handling tools, based on a relational database model. There is no limit to the quantity or complexity of the data structures.

Advanced features allow for the efficient presentation of vast amounts of information, and tools provide elegant handling of hierarchical data structures. All components are configured from control panels - there is no code debugging to do.
